

Outreach AI

Product Requirements Document (PRD)

AI-Powered SDR (Sales Development Rep) Platform

1. Product Overview

This product is a tool that uses AI to do the early, repetitive parts of sales for B2B companies: finding people who might want to buy, researching them, checking if they're a good fit, sending them a personalized message, following up if they don't reply, and booking a meeting once they say yes.

It's built for small sales teams, startups, and small/medium-sized businesses (companies smaller than big corporations from a few people up to a few hundred). Bigger sales teams, agencies, Individuals and marketing teams could also use it.

At first, every message the AI writes must be checked and approved by a human before it's sent. This is to build trust before allowing more automation later.

2. Problem Statement

Salespersons spend a lot of their time on tasks that don't directly close deals, finding leads, researching them, deciding if they're worth contacting, writing outreach messages, following up, and scheduling calls. This leaves less time for the part that actually makes money talking to interested people and closing deals.

Most tools today only solve one part of this (for example, just giving you a list of leads, or just sending emails on a schedule). This forces teams to use several different tools together. There's no single tool that reliably takes someone from "we don't know them" to "meeting booked" with very little manual work while still feeling personal, not like spam.

3. Product Goal

Help B2B sales teams get more booked meetings with much less manual work, by letting AI handle the finding, researching, qualifying, messaging, and following up while a human still checks everything before it goes out.

What we want to achieve:

- Save sales reps time on manual prospecting work

- Increase the number of qualified meetings booked
- Make sure the AI's messages feel genuinely personal, not robotic or spammy
- Prove that companies can trust AI to reach out to prospects on their behalf

4. User Roles

Role	Who they are	What they can do
Sales Rep	The main day-to-day user, manages their own leads	Set up their ideal customer type, approve/edit AI messages, see research and scores, manage follow-ups, see booked meetings
Sales Manager	Oversees the sales team	Everything a Sales Rep can do, plus manage team members, see team-wide results, set rules for the whole team
Admin	Manages the account	Manage users, billing, and connections to other tools (CRM, email, etc.)
AI Agent	The automated system itself (not a human)	Finds leads, researches and scores them, writes messages, sends approved messages, schedules follow-ups, suggests meeting times
Prospect	The person being contacted (not a user of the platform)	Receives messages, replies, books a meeting through a link

5. User Stories

Sales Representatives

- As a Sales Rep, I want to set up my ideal customer profile, so that the system only finds leads that are actually a good fit for me.
- As a Sales Rep, I want to see the research behind each lead, so that I understand why they might be a good prospect before I reach out.
- As a Sales Rep, I want to see why a lead got it's score, so that I can trust or double check the AI's judgment.
- As a sales Rep, I want to and edit the AI-written messages before they're sent, so that I can stay in control of what goes out under my name.
- As a Sales Rep, I want meetings to be booked directly on my calendar once a lead responds positively, so that I don't have to go back and forth scheduling.
- As a Sales Rep, I want to see my results on a dashboard, so that I know my outreach is performing.

Sales Manager

- As a Sales manager, I want to set rules for how the AI should send messages, so that outreach stays consistent with our brand.
- As Sales manager, I want to manage who's on my team so that I can adda or remove anyone.

Prospect

- As a prospect, I want to easily book a meeting time that works for me, so that scheduling doesn't become a hassle.
- As a prospect, I want to be able to opt out of future messages, so I'm not contacted again when not interested

Admin

- As an Admin, I want to manage billing and subscription details, so that the account stays active and up to date
- As an Admin I want to connect our CRM, email, and calendar tools so that the platform can work with the system we already use.
- As an Admin I want to control who has access to the platform, so that only the right people can use it.

6. Product Scope

6.1 What's Included (In Scope)

- Setting up your "ideal customer" profile
- Automatically finding people who match that profile
- Researching each lead (their company and contact info)
- Scoring leads to see how good a fit they are
- AI writing personalized outreach emails
- Automatic follow-up messages if there's no reply
- A human approval step before anything is sent
- Booking meetings once someone responds positively
- A simple dashboard showing results (emails sent, replies, meetings booked)
- Connections to at least one CRM, one email tool, and one calendar tool

6.2 What's Not Included Yet (Out of Scope)

- Reaching out through LinkedIn, phone calls, or text messages (email only for now)
- Letting the AI send messages with no human checking them first
- Helping close the actual deal (this stays fully human)

- Writing messages in multiple languages
- Predicting future revenue
- A mobile app
- Customizing the AI's "brain" separately for each customer

7. Feature Requirements

7.1 Functional Requirements (what the product must do)

Setting Up

- Users can describe their ideal customer (industry, company size, location, job title, etc.)
- Users can create different campaigns for different offers or customer types

Finding Leads

- The system automatically finds people who match the ideal customer profile
- Users can also add leads manually or upload a list

Researching Leads

- The system pulls together useful info about each lead's company and role

Scoring Leads

- The system scores each lead on how good a fit they are
- Users can see why a lead got that score
- Users can adjust what counts as a "good" score

Writing Outreach Messages

- The AI writes a personalized message for each lead, using what it learned from research
- Users must review and approve (or edit, or reject) each message before it's sent
- Users can tell the AI what tone or style to use

Following Up

- The system automatically sends follow-up messages on a schedule if there's no reply
- Follow-ups stop automatically once someone replies, books a meeting, or asks to be left alone

Booking Meetings

- The system notices when someone replies positively
- It offers meeting times and books the meeting directly on the rep's calendar

Reporting

- A dashboard shows: messages sent, reply rate, positive replies, and meetings booked
- Managers can see this info for the whole team

Human Checks

- Every message needs approval before sending, at least in the first version
- Later, users may be able to let certain "safe" message types send automatically

Connections to Other Tools

- Syncs with a CRM (customer database)
- Sends/receives through an email account
- Connects to a calendar to book meetings

6.2 Non-Functional Requirements (how well it must work)

- **Reliable:** The system should almost never go down (target: working 99.5%+ of the time), since missed messages mean lost sales opportunities
- **Privacy & Rules:** Must follow data protection laws (like GDPR) and email rules (like CAN-SPAM), including letting people unsubscribe
- **Secure:** Login details for CRM, email, and calendar must be stored safely (encrypted); only the right people should have access to the right things
- **Able to Grow:** Should work just as well with a few customers as with many, without needing to be rebuilt
- **Trackable:** Every message sent should be logged, showing who approved it
- **Fast Enough:** Researching and scoring a lead, and writing a message, shouldn't take too long a few minutes at most
- **Easy to Use:** Approving messages should be quick and simple, since reps will do it often if it's annoying, it defeats the purpose of saving time

8. Dependencies (things we rely on)

- Outside data sources for finding and researching leads
- An email sending service that doesn't get flagged as spam
- Access to a CRM (like HubSpot or Salesforce)
- Access to a calendar tool (like Google Calendar or Outlook)
- An AI/language model to do the research summaries, scoring, and message writing
- Pilot customers being willing to connect their real CRM, email, and calendar accounts for testing

9. Assumptions (things we're betting on being true)

- Companies will trust AI to contact people on their behalf, especially with a human checking messages first this is the biggest thing to prove
- AI-written messages can get good results (meetings booked) at a cost that competes with hiring humans or using other tools
- Testing with 3–5 real B2B companies (using existing tools to fake the experience first) will give us enough proof before we build the whole thing
- Email is still a good enough way to reach people for our first version
- Customers already have (or are willing to set up) a CRM, email, and calendar we can connect to

10. Success Metrics (how we'll know it's working)

- **Usage:** How many reps are actively using it each week
- **Time saved:** How much less time reps spend on manual prospecting
- **Message quality:** How many people reply, and how many reply positively, compared to doing it manually
- **Results:** How many qualified meetings get booked per week/month
- **Conversion:** What percent of qualified leads turn into a booked meeting
- **Trust:** How often reps approve AI messages without editing them (shows how good the AI is getting)

- **Keeping customers:** Whether customers stick around and grow their usage after the trial period

11. MVP (the first, simplest working version)

The first version should prove the core idea works: find someone → research them → check if they're a good fit → write them a personalized message → a human approves it → send it → follow up if needed → book the meeting. Email only, to start.

1. Set up ideal customer profile
2. Find leads
3. Research leads
4. Score leads
5. AI writes personalized messages
6. Human approves before sending
7. Send email
8. Automatic follow-ups
9. Book meetings
10. Simple results dashboard

Pricing to test later: probably a subscription first, but also considering charging per user, per lead, per qualified lead, per booked meeting, or a custom price for big companies.

12. Future Enhancements (things to add later)

- Reaching out via LinkedIn, phone calls, or text messages
- Letting the AI send some messages without needing approval every time
- Writing messages in different languages
- Better two-way syncing with CRMs
- Smarter analytics, like predicting future revenue
- Testing different message styles against each other automatically
- A mobile app for reps

- Ready-made setups for different industries
- Training the AI to match each customer's specific voice/brand

13. Open Questions (things still to decide)

- Which CRM, email tool, and calendar tool should we connect to first?
- What legal/privacy rules apply in the markets our pilot customers are in?
- How fast does research and message-writing need to be?
- Which pricing model should we test first with pilot customers?
